Experiment 6

Student Name: Ankush **UID: 23BCS12742**
Branch: CSE **Section/Group: KRG 3-B**
Semester: 6th **Date of Performance:03/03/2026**
Subject Name: Full Stack Development – II **Subject Code: 23CSH-309**

1. **Aim**: To design and implement a **Spring Boot REST API using Layered Architecture**, applying **Inversion of Control (IoC)** and **Dependency Injection (DI)** to build a structured backend for the **HealthHub application**, including CRUD operations, DTO mapping, validation, and global exception handling.

2. Objective:

- Understand the role of **Spring Boot in backend development**
- Configure and run a **basic Spring Boot application**
- Apply **IoC (Inversion of Control)** and **Dependency Injection**
- Use Spring annotations such as **@Autowired, @Service, and @Repository**
- Implement **Layered Architecture (Controller – Service – Repository)**
- Develop **RESTful APIs using Spring Boot**
- Perform **CRUD operations (Create, Read, Update, Delete)** using HTTP methods
- Implement **DTO mapping** to separate internal data models from API responses
- Apply **validation using Jakarta Validation annotations** like `@NotNull`, `@Email`
- Implement **Global Exception Handling using @ControllerAdvice**
- Build backend services for **HealthHub patient management system**.

3. Implementation / Code:

▪ Tools & Technologies Used:-

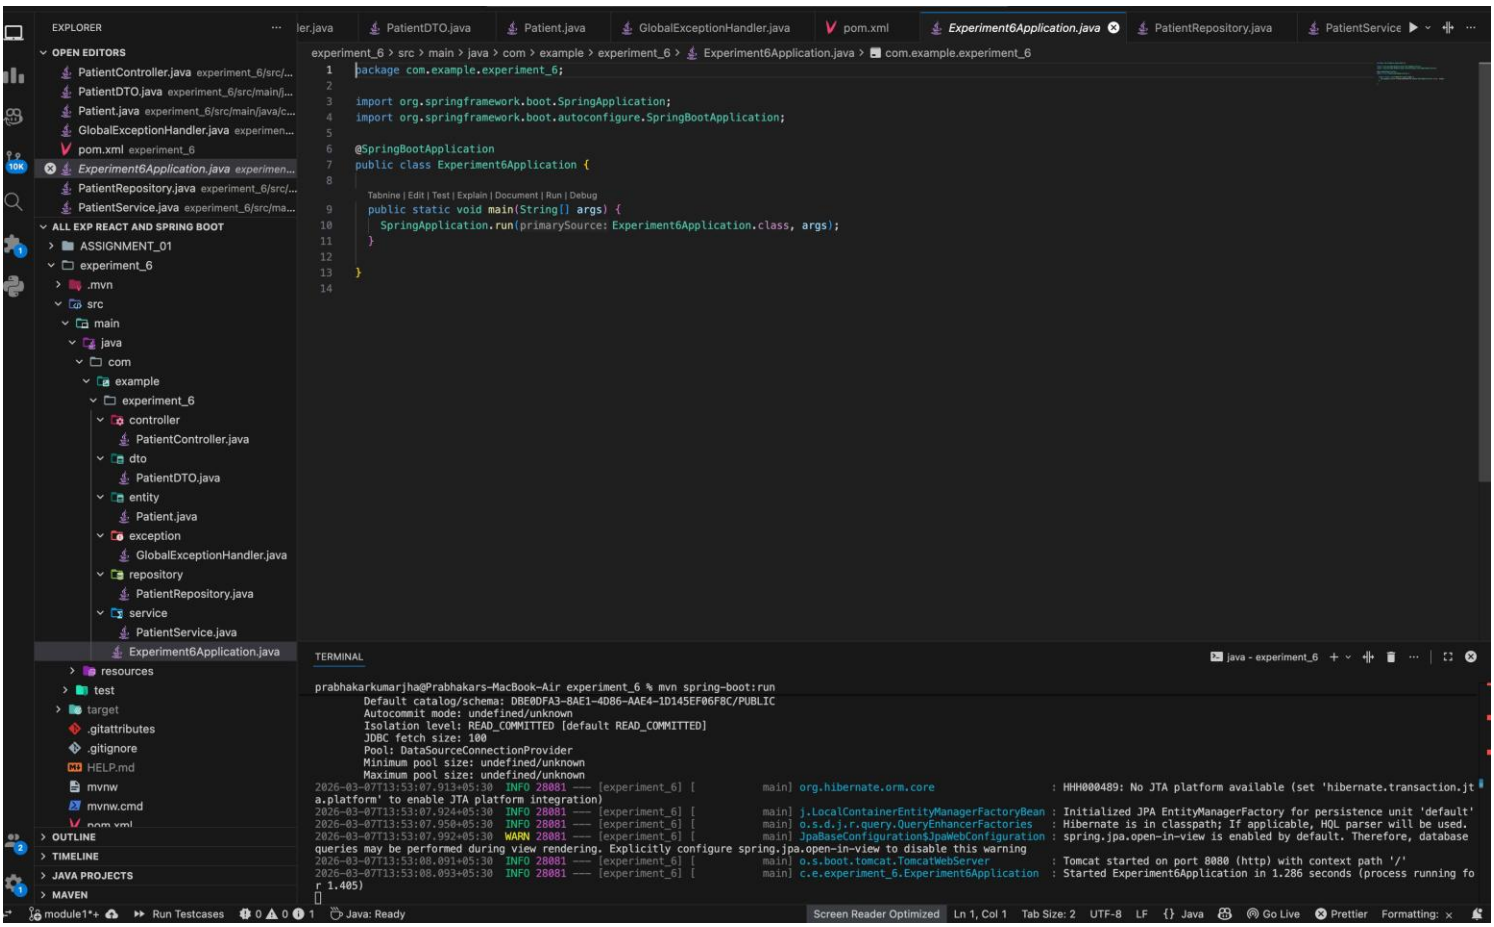
- Java
- Spring Boot
- Spring Web
- Spring Data JPA
- Maven
- VS Code
- Postman (API testing)
- H2 Database

▪ Implementation Description:-

• A **Spring Boot application named HealthHub** is created to manage patient data.
• The project follows **Layered Architecture**, separating logic into different layers:

- **Controller Layer**
  Handles HTTP requests and responses using REST APIs.
- **Service Layer**
  Contains business logic for managing patients.
- **Repository Layer**
  Communicates with the database using Spring Data JPA.
- **Entity Layer**
  Represents database tables.
- **DTO Layer**
  Transfers patient data between API and application.
- **Exception Layer**
  Handles errors globally using `@ControllerAdvice`.

▪ Project Structure:-



4. Output:

- Spring Boot application started successfully on **localhost:8080**
- POST API successfully added patient records
- GET API returned the list of patients stored in the database
- GET by ID API returned specific patient details
- DELETE API successfully removed patient data
- Postman confirmed successful API responses with **Status 200 OK**
- Layered architecture ensured separation of concerns and clean backend design

5. Learning Outcomes (What I Have Learnt):

- Understanding of **Spring Boot backend development**
- Implementation of **Layered Architecture (Controller, Service, Repository)**
- Usage of **Dependency Injection in Spring Boot**
- Development of **RESTful APIs using HTTP methods**
- Implementation of **CRUD operations in backend applications**
- Understanding of **DTO mapping for API communication**
- Applying **validation annotations for data integrity**
- Handling errors globally using **Spring Exception Handling**
- Testing APIs using **Postman**
